

Evidence Engine Report

Summary

Site: <http://127.0.0.1:61546> · scan started 2026-10-29T16:53:46.121Z
2 finding(s) in this scan (1 high · 1 medium).

There is no earlier scan of this site to compare with, so nothing is reported as new, persistent or repaired yet.

Coverage: Scan completed. 4 page(s) inspected; 4 of 3 eligible link target(s) checked.

Findings are observed technical conditions. Whether one affects a particular visitor journey is not assessed here. Technical detail follows in this report.

2 findings in scan, 2 exported
16 audit rows, 16 exported
Findings show each finding's recorded state at the time of this export (its latest observation, outcome and rechecks). They are not a reconstruction of how the findings stood when this scan finished. The audit rows are the original record of this scan.

Origin: <http://127.0.0.1:61546>
Generated: 29/10/2026, 10:24:45 pm
Scan id: 0a66af8d-0518-4874-a029-1e9a547381a3
2 finding(s) this run (1 high · 1 medium)

Last scan (29/10/2026, 10:23:46 pm) completed successfully. Checked 3 of 3 discovered same-origin links.

Coverage

Discoverable site scan within configured scope (profile: bounded_site, up to 4 page(s), up to 6 link target(s)). Checks run: Page availability, Link target availability, Resource (image/script/etc.) failures, Uncaught JavaScript exceptions, Console errors (console.error only), Horizontal overflow. Not run: Accessibility (automated, axe-core), Visual comparison (local). Viewports: desktop 1280x800; phone browser not run. Crawling cannot establish coverage of every application state, role, hidden route, or business workflow.

Network scope: links to other sites and sitemap entries on other sites are listed but not requested. If a page on the site redirects to another site, the scan's browser follows that redirect and loads the other site's page once, without the scan's Basic Auth login or cookies, and the result is reported as a redirect. Every page the scan opens also loads its own images, scripts and fonts from wherever the page points, as any browser would.

Addresses: in this app, in exports and in the saved database, query and fragment values are hidden unless they are plainly harmless (a short number, or a value such as page or sort). A hidden value shows as a short tag, so the same address always shows the same tag. The exact address of a finding is kept in one copy, protected with Windows, and is used only to recheck that finding. This is best effort: a secret inside the path of an address, in page text or in a screenshot is not removed.

Pages inspected	4
Link targets checked	0
Frames inspected	0
Popups inspected	0
Pages inspected in the phone browser (390x844)	0
Raw link occurrences	7
Unique targets discovered	3
Eligible targets	3
Selected targets	3
Attempted	4
Completed	4

Blocked	0
Eligible, not attempted (limit reached)	0
Still queued when scan stopped	0
Defect confirmation (each candidate re-tested 3 times, target only)	
Defect candidates	2
Confirmed (3 of 3)	2
Intermittent (1 or 2 of 3)	0
Unable to verify — server throttling	0
Unable to verify — no response	0
Unable to verify — blocked	0
Not reproduced (not reported)	0
Unconfirmed (confirmation budget reached)	0
Confirmation attempts	6
Skipped, by reason	
Duplicate target	4

Duplicate target: 4. Same address seen again, not a separate row in the skipped group.

Accessibility check (automated): not run for this scan.

Visual comparison (local): not run for this scan.

robots.txt: The site has no robots.txt (HTTP 404), which crawlers treat as permission to fetch everything, so nothing was held back.

Technical audit (Staging or pre-launch copy)

How to read this section

- Judged as: Staging or pre-launch copy. Pages that ask search engines not to index them are expected here and are listed for information only. A staging page that search engines could index is flagged for review.
- Computed when this export was made, from the page facts stored at scan time, by the rules of Evidence Engine v0.2.0 (build 0a8c9ca0). The results are not frozen at scan time: a later build, or different thresholds, may judge the same stored scan differently.
- Thresholds used: titles 15-60 characters, meta descriptions 70-160 characters, near-duplicate content from an estimated 90% text similarity, pages under 30 words not compared. These are conventions, not rules.
- Items marked heuristic are judgement calls or estimates (length guidelines, similarity estimates, touch-target and text sizes, structured-data eligibility); they are for review and are not defects. Only items in the first group, Confirmed problems, are observed contradictions.
- Coverage: 3 pages judged; 1 not judged (not a loaded web page); 0 section links checked; 0 pages compared for duplicate text; 3 not compared (too little text, text cut at the read limit, or beyond the comparison limit); 0 JSON-LD blocks read (Microdata and RDFa are not read); 3 not read in the phone browser (the phone check is optional and needs the horizontal-overflow check).
- Custom search results say 'not evaluated' where a page's HTML was cut at the read limit and nothing was found in what was read, where a pattern timed out, or where a page could not be read. None of those is reported as absent or clean.
- The audit judges the pages the scan reached and loaded. It is not a complete audit of the site. Whether the scan applied robots.txt is stated in the coverage record (older settings do not apply it).

Confirmed problems (0)

The page contradicts a rule on its own, as observed in the loaded page.

Nothing to report in this group.

Warnings (3)

Very likely a problem, but not wrong by specification.

No meta description

The page has no meta description.
http://127.0.0.1:61546/

No meta description	The page has no meta description. http://127.0.0.1:61546/contact
No meta description	The page has no meta description. http://127.0.0.1:61546/services
Needs your review (5) A judgement call or a convention (such as a length guideline). Decide whether it matters for this site.	
Staging page that search engines could index heuristic	This staging page does not ask search engines to stay away (no noindex). http://127.0.0.1:61546/
Staging page that search engines could index heuristic	This staging page does not ask search engines to stay away (no noindex). http://127.0.0.1:61546/contact
Staging page that search engines could index heuristic	This staging page does not ask search engines to stay away (no noindex). http://127.0.0.1:61546/services
Short page title heuristic	The title is short (7 characters; heuristic minimum 15). http://127.0.0.1:61546/contact
Short page title heuristic	The title is short (8 characters; heuristic minimum 15). http://127.0.0.1:61546/services

For information (0)

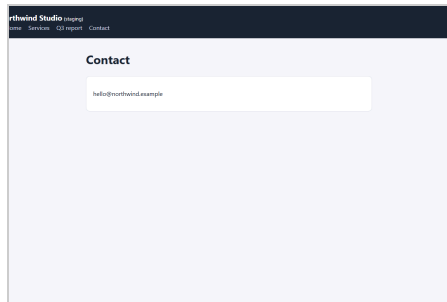

Reported for completeness. Not a defect in the chosen context.

Nothing to report in this group.

Staging-to-production comparison: not included. No saved comparison exists for this site; run `compare-environments` after scanning both sites to add one.

Not tested by this scan: business workflows or multi-step journeys (checkout, form submission, purchases — this scanner never performs any of these); interaction-triggered popups (opened only after clicking a control); authenticated states beyond whatever this run's own session/credentials covered; application states or hidden routes this crawl did not discover within its configured scope; console warnings and log messages (only console.error is recorded, and only during page load; JavaScript exception capture also covers the page load only, so an error raised later by a timer or after a click or scroll may be missed); phone-specific behaviour beyond horizontal overflow (the phone pass uses Chromium mobile emulation — a 390x844 viewport at device scale 3, one fixed Chrome on Android identity and touch — and checks horizontal overflow only; it is an emulation, not a test on a physical phone).

Severity is derived from stored scan data only: high = 5xx page/link response or uncaught JavaScript exception; medium = 4xx page/link response or console.error; low = failed sub-resource or horizontal overflow. A later recheck changes the outcome, never the severity recorded for an earlier observation.

Screenshot supplements the evidence below; it does not by itself prove the exception's impact.

UNCAUGHT EXCEPTION

<http://127.0.0.1:61546/contact>

JavaScript error during page load: TypeError: Contact form widget failed to initialise

Steps to see it

1. Open the scan's start address: <http://127.0.0.1:61546/>
2. On that page, find the link "Contact" and open it: <http://127.0.0.1:61546/contact>
3. Result on <http://127.0.0.1:61546/contact> in a desktop browser: JavaScript error during page load: TypeError: Contact form widget failed to initialise

HIGH SEVERITY

CONFIRMED · JAVASCRIPT ERROR OBSERVED

Last completed inspection: 29/10/2026, 10:24:09 pm — defect observed.

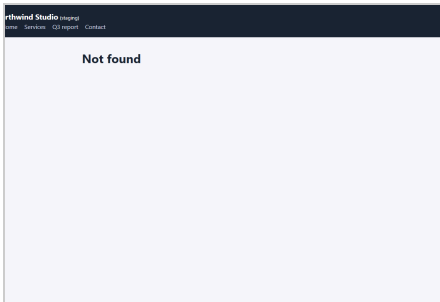

User impact: not verified. A background script error can occur while the page's visible functionality keeps working normally — this does not, on its own, establish a customer-facing defect.

Diagnostic details

ERROR TYPE	TypeError
MESSAGE	Contact form widget failed to initialise
SCRIPT LOCATION	http://127.0.0.1:61546/contact:1:880
PAGE URL	http://127.0.0.1:61546/contact
CAPTURED	29/10/2026, 10:24:09 pm
SCAN ATTEMPT	0a66af8d-0518-4874-a029-1e9a547381a3
STACK TRACE	TypeError: Contact form widget failed to initialise at http://127.0.0.1:61546/contact:1:880

Suggested investigation steps:

- Open the page URL above: this error was captured during page load, so a plain reload reproduces it if it is deterministic.
- Check whether the error correlates with a specific user action, or fires on page load regardless of interaction.
- Confirm whether any visible feature actually fails, or whether this is a background error with no observed user-facing effect.
- If this is a third-party script's error (analytics, ads, embeds), consider whether it's actionable at all versus expected noise from a page not under this site's control.

PAGE FAILURE

http://127.0.0.1:61546/reports/q3-summary

HTTP 404 when this page is requested — failed on 3 of 3 re-tests.

Steps to see it

1. Open the scan's start address: http://127.0.0.1:61546/
2. On that page, find the link "Q3 report" and open it: http://127.0.0.1:61546/reports/q3-summary
3. Result in a desktop browser: HTTP 404 when this page is requested — failed on 3 of 3 re-tests.

MEDIUM SEVERITY

CONFIRMED

Last completed inspection: 29/10/2026, 10:24:09 pm — defect observed.

The failed request itself is directly observed. Whether it affects a specific user-facing flow beyond this request is not independently assessed.

Request details

STATUS CODE	404
